Abstract:

Introduction: The need for academic credentials for politicians is a topic of much discussion worldwide. As a result, Nepal being divided into federal, provincial, and municipal levels, political leaders from diverse parties have emerged, raising questions about their academic credentials for the roles they have at various levels of the state. This study tries to demonstrate how Nepalese voters view the importance of academic credentials for politicians.

Methods:A descriptive cross-sectional study was conducted among 200 voters in Nuwakot district, Bagmati Province, using a semi-structured questionnaire. The data analysis was performed in SPSS version 20 including univariate and bivariate analyses with 93.5% of Cronbach's alpha test.

Results: The findings shows voting behavior and preferences, including frequency of voting, party loyalty, perceived importance of votes, and research conducted on candidates. The study highlights the perception of voters towards qualities of elected candidates, emphasizing the value placed on education, systematic development, and ethical conduct. The study presents the ranking of candidate qualities, with well-educated candidates and those who consider consequences being highly regarded.

Conclusion: In addition to advocating for gender equality, raising women's political knowledge, improving educational possibilities, supporting thorough candidate screening, and boosting openness and responsibility in politics are suggested.

Keyword: Voter's perception, educational level, politician's qualification, Nepal

Introduction

An individual's personal and professional lives are greatly impacted by their education. After completing formal schooling, one may be academically qualified. In order to combat the political instability across all countries, especially in low- and middle-income countries, education has become a crucial necessity income (1). A certificate, diploma, or degree is a sort of academic qualification that attests to the achievement of program or stage success in

International Journal of Economic Perspectives,16(12), 215-225 UGC CARE GROUP II Retrieved from https://ijeponline.com/index.php/journal

education (2). Politicians are key players in governing the nation's political system. They have the authority to enact laws and represent the interests of the people, which emphasizes the need for effective leadership (3).

There are many debates around the world regarding the requirement of academic qualifications for politicians. There are also previous studies that depict the significant relationship between a higher level of education and disposition to engage in politics (4). The interdependence of politics and education is evident, as academic qualifications play a crucial role in shaping effective political leadership and decision-making processes (5). The relationship between politics and education is complex, particularly in low and middle-income countries like Nepal, where the academic qualification of politicians is lacking, resulted in an educational gap, contributing to political instability and hindered development in the country. The categorization of Nepal into federal, provincial, and local levels has led to the emergence of political leaders from various parties, raising concerns about their academic qualifications for the positions they hold at different levels of the state.Nepal's slow-paced development and persistent poverty and hunger contrast with the progress of its neighboring countries(6).

Political instability, corruption, nepotism, and a lack of accountability and transparency, stemming from a deficiency in academic qualifications among politicians, impede the nation's progress and hinder effective leadership qualities(7). Undoubtedly, a lack of academically qualified politicians can disrupt the smooth functioning of the activities to run the country peacefully leading to frequent strikes and increasing corruption (8). Hence, this study aims to highlightthe voters' perception on the need for academic qualification among the politicians of Nepal.

Methods

A descriptive cross-sectional study was conducted among 200 voters from the Nuwakot district of Bagmati Province, Nepal. The participants having voter card were collected data by using the semi-structured questionnaire and a face-to-face interview, after getting permission from the individual. The collected data was entered into SPSS version 20 for analysis where univariate and bivariate analyses was done and Cronbach alpha test was run to test the internal reliability of the Likert-scale questions, which was 93.5%.

treatment to everyone respectively. Likewise,44.5%, 58%, 48% and 43.5% strongly agreed on elected candidates analyze the consequences before taking any decisions, on elected candidates be well-educated, educated politicians can develop country systematically and educated politicians can better understand situations and problems of people respectively. Similarly, 48.5% agreed on educated politicians can ensure fair treatment and equality, 46% strongly agreed on education should be mandatory for participating in politics and 51.5% agreed on educated politicians understand culture and norms of community.

Association between voters' perception and socio-demographic characteristics of the participants

Table 4: Mean score and standard deviation of perception towards qualities of elected candidates

SN	Statements	Mean ± SD
1	Elected candidates should be honest.	4.11±1.011
2	They should have strong ethics and values	3.91±0.903
3	They should have ability to persuade other people.	3.95±0.837
4	They should be able to listen to others and respect their views.	4.10 ± 0.783
5	They should have equal treatment to everyone.	4.18±0.825
6	They should be able to deal even difficult situations patiently.	4.16±0.925
7	They should analyze the consequences before taking any decisions.	4.27±0.843
8	They should have good connection and network	4.15±0.921
9	They should bring about positive impact on others.	4.23±0.847
9	They should possess good communication skills.	4.13±0.885
10	They should be well-educated.	4.39±0.895
11	Educated politicians can develop country systematically.	4.27±0.895
12	Educated politicians can better understand situations and problems of	4.21±0.848
	people.	
13	Educated politicians can ensure fair treatment and equality.	4.14±0.880
14	Education should be mandatory for participating in politics.	4.20±0.939
15	Educated politicians understand culture and norms of community.	4.10±0.866

Table 4 showed that the perception towards qualities of elected candidates revealed that being well-educated (4.39 \pm 0.895) was considered the most important attribute, followed by the ability to develop the country systematically (4.27 \pm 0.895) and analyze consequences before making decisions (4.27 \pm 0.843). Other valued qualities included bringing about a positive impact on others(4.23 \pm 0.847), understanding the situations and problems of the people(4.21 \pm 0.848), and advocating for equal treatment(4.14 \pm 0.880). Factors such as good communication skills (4.13 \pm 0.885), honesty(4.11 \pm 1.011),respect for others' views(4.10 \pm 0.783), cultural understanding(4.10 \pm 0.866), and persuasion abilities(3.95 \pm 0.837) were also deemed significant. However, having strong ethics and values (3.91 \pm 0.903) received the lowest mean score.

Table 6 shows the relation between the age of the respondents (p=0.001, chi-square= 94.792), marital status (p=0.001, chi-square=52.169), religion (p=0.001, chi-square=14.741), educational status (p=0.001, chi-square=36.044), occupational status (p=0.001, chi-square=67.731) and monthly family income (p=0.001, chi-square= 29.96) with times voted in elections.

Discussion

The study findings indicate a diverse educational background among the respondents, with a range of educational levels represented such as higher secondary (29.5%), secondary (23.5%), bachelor's (21%), primary (10%), master's (8%). These results demonstrate the varying educational profiles within the population surveyed. Education is necessary for the economic and social development of the country (9) and for divisive issues as well as across the many committees and periods (10). Study done in England found that a more marketed and vertically stratified higher education system has circumscribed the political engagement of the students (11). Some study showed that more educated leaders lead to more educated citizens (12).

In this study, a higher percentage of male respondents (44.5%) reported conducting more research on candidates before elections compared to women (29%). These results suggest that women exhibit less engagement and awareness in the political sphere compared to men. This finding is supported by another study (4,13) and factors such as dependency on men, lack of interest in politics, and aversion to conflict may contribute to the lower participation of women(14). The study highlighted the importance of being well-educated, developing the country systematically, and analyzing consequences before making decisions as the most valued qualities in elected candidates. Some studies found leadership and integrity were necessary but the people wanted the candidate to be passionate and kind (15), presented to the public (16), equal treatment, patience, consulting others, have good connection and network (17). The policy making is dominated by a highly educated minority in the Netherlands (18).

In general, a majority of the respondents in the study (67.5%) had participated in elections © 2022 by The Author(s). ISSN: 1307-1637 International journal of economic perspectives is licensed under a Creative Commons Attribution 4.0 International License.

International Journal of Economic Perspectives,16(12), 215-225 UGC CARE GROUP II Retrieved from https://ijeponline.com/index.php/journal

multiple times, as voters would actively participate in the upcoming future elections (19). This study showed that 58.5% responded social media the most effective source of information regarding last elections. Supporting this cause, similar studies has also shownthe impact of social media in the society and politics(20), and influenced by TV (21,22). There was negative correlation between education and perception towards elected candidates, but monthly income of the family was moderately correlated in this study. Similar findings were observed in study by (23) which showed weak correlation was found in terms of gender, education and occupation while moderate correlation was found with monthly income.

Additionally, a significant percentage (78%) indicated that they would still vote for a party regardless of its chances of winning, and (73.5%) reported conducting sufficient research on candidates before elections where (13)showed similar findings. Studies shown that occupational background does not seem to matter for American students (24) however New Zealand students are less likely to vote for a candidate with a business background (25), citizens who are members of professional organizations generally believe politicians are less honest (26). Also, voters with higher political sophistication consider various candidate characteristics, including competence, experience, and issue positions. (27).

Conclusion

In conclusion, this study highlights the diverse educational background of the respondents and the disparities in research conducted on candidates before elections, particularly among women. It emphasizes the importance of being well-educated, developing the country systematically, and considering consequences in decision-making for elected candidates. Factors like positive impact, understanding people's situations, advocating for equal treatment, and strong communication skills are also valued by the voters. The study indicates active civic participation with multiple voting experiences and party allegiance. The study recommends promoting gender equality, increasing political awareness among women, enhancing education opportunities, encouraging comprehensive candidate research, and fostering transparency and accountability in politics.
